

Pannon Egyetem

*Mesterséges Intelligencia megoldásokat fejlesztő adat- és
rendszertudományi szakember képzés*

Szakdolgozat beszámoló

Kriskó Nándor

Témavezető:

Dr. Czúni László

Sávdetektálás mélytanulási módszerek alkalmazásával

- Feladat bemutatása
- Elérhető módszerek
- State of the art modellek
- Alkalmazott U-Net modell bemutatása
- Optimalizálás, finomhangolás
- Bővítés gépjármű detekcióval

A feladat

- **Sávdetektálás módszertanainak vizsgálata**
- **Adatbázisok keresése**
- **Sávdetektáló módszer implementálása**
- **A modell optimalizálása**
- **Közlekedő autók felismerése -> objektum detektálás**
- **A két rendszer összehangolása és futtatása**

A sávdetektálás nehézségei

- Változó időjárási körülmények
- Változó közlekedése körülmények
- Útburkolati jelölések hibái

State of the art és benchmark

Dataset függő, hogy melyik az aktuális legjobb

Dataset	Model	Method
TUSimple	RESA	Segmentation
CULane	CLRNet	"Anchor box"
CurveLanes	CondLaneNet	"Anchor box"
Llamas	CLRNet	"Anchor box"
BDD100k	YoloPv2	Segmentation

A környezeti körülmények erősen befolyásolják az eredményeket.

State of the art és benchmark

Kísérlet szegmentáló hálózatokkal: U-Net

- 2015-ben alkotta meg
O. Ronneberger et al.
- Encoder – decoder felépítés
- Encoder: Conv2D 3x3,
Maxpooling2D 2x2
- Decoder: Conv2DTranspose 2x2,
concatenate , Conv2D 3x3
- Skip connections

TUSimple adatbázis

- 6408 db autópályán készült kép
- 3626 db train + 2782 db teszt
- 1280x720 felbontás
- 1 sec videó -> 20 db kép -> utolsó van annotálva
- annotálás: .json file ; pixelek, melyeken sáv található

```

Augmentálás

A train képek 15%-a augmentálva, majd ezzel növelve az eredeti képmennyiség.

Módszerek:

- `tf.image.flip_left_right` – tükrözés
- `tf.image.random_contrast(image, 0.2, 0.6)`
- `tf.image.random_brightness(image, max_delta=0.4)`

Attention modell

Térbeli fókusz, a jellemzők további kiemelésére szolgál

```
def spatial_attention_module(input_tensor):  
  
    avg_pool = tf.keras.layers.GlobalAveragePooling2D(keepdims=True)(input_tensor)  
    max_pool = tf.keras.layers.GlobalMaxPooling2D(keepdims=True)(input_tensor)  
  
    concat = tf.keras.layers.Concatenate(axis=-1)([avg_pool, max_pool])  
    attention_map = tf.keras.layers.Conv2D(1, (7, 7), padding='same', activation='sigmoid')(concat)  
  
    return input_tensor * attention_map
```

```
x = layers.Conv2DTranspose(512, (2, 2), strides=(2, 2), padding='same')(x)  
skip1 = spatial_attention_module(encoder_outputs[-2]) |  
x = layers.concatenate([x, skip1])  
x = layers.Conv2D(512, (3, 3), activation='relu', padding='same')(x)  
x = layers.Dropout(dropout_rate)(x)  
x = layers.Conv2D(512, (3, 3), activation='relu', padding='same')(x)
```

Eredmények

500db teszt kép eredményének az átlaga

unet + resnet50 + augmentation + attention	0,830	0,774	0,983	0,800	0,672	0,801

Eredmények

500db teszt kép eredményének a szórása (Dice score):

- minimum (kép 88: 0,471)
- maximum (kép 245: 0,923)
- átlag (kép 123: 0,811)

Járműdetektálás

YOLO modell alkalmazása: (COCO dataset; 80db osztály)

Backbone: CSPNet

One-to-many head: sok predikció / objektum tanításkor

One-to-one head: 1 predikció / objektum futtatáskor

```
from ultralytics import YOLO

# Load a pre-trained YOLOv10n model
model = YOLO("yolov10n.pt")

# Perform object detection on an image
results = model("image.jpg")

# Display the results
results[0].show()
```

Sávdetektálás

A sáv kimeneti kép morfológiai javítása:

- Blur
- Predikció
- Normalizálás - threshold
- Skeletonize
- Region Of Interest
- Countour extraction -> contour length

Járműdetektálás, a kettő kombinálása

Yolo predikcióból kiolvasni:

- ID a követéshez
- Box koordináták
- Osztály feliratok

Fejlesztés: saját sáv

1. Bounding box azonosítása (piros téglalap)
2. X szerinti középső koordináta keresése (sárga pont)
3. A kép közepével való összehasonlítása (fehér pont), hogy bal vagy jobb oldali-e
4. A bal és jobb oldaliak közül a középponthoz legközelebbi kiválasztása
5. Azonosított kontúrok kirajzolása a képre
